Krishna Steel ERP - How to Give a Licence Key

Simple steps. Everything is done on Windows. No Ubuntu and no commands.

What you need

- The file **Krishna-Key-Generator.html** (it opens in Chrome or Edge on any Windows laptop, with or without internet).
- Your **passphrase** (the password that unlocks that file).

Giving a key to a client

1. **Send the app zip** to the client (Windows 10/11, Windows 7 64-bit, or Windows 7 32-bit).
2. The client opens the app. A screen says **"Activation required"** and shows a **Machine ID**, for example `60EC-922A-22A2-A2E2`. The client presses **Copy** and sends it to you on WhatsApp.
3. On your laptop, **double-click Krishna-Key-Generator.html**. It opens in the browser.
4. Type your **passphrase** and press **Unlock**.
5. Fill in 3 things:
    - **Machine ID** - paste what the client sent.
    - **Client name** - for example Krishna Steel.
    - **Valid for** - choose 1 month, 3 months, 6 months, 1 year, 2 years, Never expires, or a fixed date.
6. Press **Generate key**. A long licence key appears.
7. Press **Copy key** and send it to the client on WhatsApp. (You can also press **Save as .txt**.)
8. The client pastes the key in the box and presses **Activate**. The app opens.

Renewing later

1. 15 days before the end date the app shows a yellow warning bar.
2. When the client pays again, do the same steps above with a new "Valid for" choice. The client pastes the new key on the lock screen and presses Activate.
3. If the client does not pay, do nothing. The app locks by itself on the end date. Their data stays safe and returns when they get a new key.

Looking back at keys you made

The page keeps a list of keys made on that laptop (date, client, Machine ID, end date) with a **Copy key** button for each. The list is saved only in that browser on that laptop.

Changing your passphrase

1. Unlock the page, scroll down to **Change passphrase**.
2. Type the new passphrase twice and press **Save new file**.
3. A new **Krishna-Key-Generator.html** downloads. Use that new file from now on and **delete the old file** (the old file still opens with the old passphrase).

Keep it safe

- **Keep at least two copies of Krishna-Key-Generator.html** (laptop and pen drive). If every copy is lost, you cannot make keys for apps already sold.
- Do not share the file or the passphrase. Anyone with both can make keys.
- If the file is stolen it is locked, but a weak passphrase can be guessed. Use a long one and change it if you ever shared it.

Common situations

What happened	What to do
Client buys a new computer or reinstalls Windows	The Machine ID changes. Ask for the new Machine ID and make a new key.
Client renames the computer or changes the processor	Same: new Machine ID, new key.
Client copies the app to another PC	It stays locked there because the key fits only the first PC.
Client sets the PC date back to get more days	The app notices and locks with "date looks wrong". They must set the correct date.
Client edits the key text	The key is rejected. Any change breaks it.
Message "key issued for a different computer"	The Machine ID typed in the page was wrong. Ask the client to copy it again from the screen.
Page says "Wrong passphrase"	Type it again carefully. There is no reset, so keep your passphrase written somewhere safe.

Where the copyright appears

"© 2026 Sonali Kadam. All rights reserved." shows on the lock screen, login screen, the bottom of every page, the printed invoice/bill and the PDF sent on WhatsApp. The app also shows "Licensed to (client) until (date)".

Honest limits

- You **cannot switch a client off before the end date**, because this works without internet. Use shorter keys (3 or 6 months) for more control.
- This stops copying and use after the end date. A skilled programmer could try to remove the lock from the app files, so also keep a written agreement with the client.
- Keep your own list: client name, Machine ID, end date, date you sent the key.
